

Class Engagement Report

Class | classroom_session.mp4 | recorded | 36m 28s | generated 31 August 2026, 10:12

Average engagement	95%
Lowest point	33% at 1m 16s
Attention drops detected	8
Measurement coverage	84% of session (342s without a clear view)
Phone use	visible for 2% of session (peak 2 at once)

Engagement across the session

The line traces class engagement over time; the dashed rule marks the session average. Shaded areas mark sustained periods below that average.

Data quality note. Students were clearly visible for 84% of this session. The remaining 342 seconds are excluded from the figures rather than counted as disengagement, since an absence of measurement is not evidence of inattention.

Moments that warrant attention

Period	Lowest engagement
15m 02s - 15m 09s	67%
15m 45s - 15m 49s	50%
20m 11s - 20m 30s	50%
22m 34s - 22m 42s	33%
24m 07s - 24m 12s	67%
28m 03s - 28m 09s	75%
31m 39s - 31m 44s	33%
36m 21s - 36m 26s	100%

Engagement by seating zone

	Col 1	Col 2	Col 3	Col 4
Front	92%	91%	92%	100%
Middle	95%	93%	96%	96%
Back	97%	89%	94%	94%

Rows are ordered from the teaching position toward the back of the room.

Recommended actions

The following are derived from the patterns in this session's data. They are prompts for your own judgement rather than instructions: you know what was being taught at each moment, and that context takes precedence over the measurement.

A strong session. Average engagement was 95.3%, which is high. The class stayed with you throughout, so the priority now is consolidation rather than correction: material delivered to an attentive room is best secured by a short recap while it is still fresh.

Suggested recap for the end of class. A closing recap of five minutes would consolidate a session this strong. Prepare one slide for each main idea covered, each carrying a single sentence and its supporting diagram, and work through them in the order taught. Showing the diagram first and asking the class to supply the idea, rather than the reverse, tests recall rather than recognition. Entering a lecture plan before the next class will allow this suggestion to name the specific topics.

One passage to include in the recap. Even in a strong session, engagement dipped to 66.7% between 15m02s and 15m09s. This is the passage most worth including in the recap.

How to use this report

This report is a private aid to your own reflection on the session. It is not an assessment of your teaching, and it is not a record of individual students: every figure describes the class as a whole, and the recording was deleted once analysis finished.

The most useful way to read it is to work backwards from the flagged moments. Take each timestamp above and recall what was happening at that point - which concept you were introducing, which format you were using, how long you had been speaking without interruption. The system can identify *when* attention fell; only you can supply the *why*, and it is the combination that turns a measurement into a teaching decision.

In the short term, the flagged periods indicate material worth revisiting next session. Over several sessions, comparing reports shows whether a change you made - different pacing, an added activity, an earlier break - had a measurable effect. And when preparing the material again, the periods of highest engagement are as informative as the lowest.

A single report is one observation, not a conclusion. Engagement varies with time of day, point in term, and factors outside the classroom. Patterns persisting across sessions are meaningful; a single unusual session usually is not.

Interpreting the measurement

This system measures **behavioural** engagement: observable signals such as head orientation, posture, stillness and visible device use. It does not measure understanding or interest. A student may be attentive while still, or thinking deeply while looking away; apparent attention does not guarantee comprehension.

Detection accuracy varies with conditions. Students furthest from the camera, partially occluded, or working head-down are measured less reliably, and fairness analysis has shown accuracy is not uniform across individuals. This is why results are reported only at class level and never used to characterise any individual student.
